Lab Task 01: Personal Portfolio Webpage

Instruction:

- 1. Complete the task**
- 2. After completion, push the code in the GitHub repository.**

Scenario:

Imagine you're a computer science student preparing for an internship. Your goal is to build a personal webpage to introduce yourself to potential employers. The homepage should clearly show your name, a short description, your education table, and a form for visitors to contact you. Use semantic HTML5 tags to structure your content clearly (header, main, footer).

Steps:

Design a personal portfolio page using HTML semantic elements. Include:

- A header with your name and navigation bar (<header>, <nav>).
- A short biography section (<section>).
- A table showing your educational qualifications.
- A contact form.
- Metadata in the <head> section (title, author, description, keywords).
